Section 2

Task 5: Debugging and Fixing Terraform Issues

Invalid provider configuration:

To debug these errors, we can go to the official Terraform Provider Registry at <https://registry.terraform.io/browse/providers> and search for the provider that we are having issues with.

Incorrect security group rules:

We can check the official documentation at https://registry.terraform.io/providers/hashicorp/aws/5.16.0/docs/resources/security_group.html and search for the part we're having problems with. For simulating Security Group configurations, we can go to the AWS console and create the security groups that we would like to configure in Terraform, see how it behaves over there and then replicate it in Terraform.

Missing IAM permissions for Terraform to create resources:

Run "terraform apply" until an error occurs. Look at the output or at the terraform log output to see what API call failed and then add it to the deployment user policy. Repeat until no errors occur.
